Piedmont, SC 29673

Subject: Fairfield Mine Permit — Storm Water Runoff Design Summary

This letter and accompanying attachments provide guidelines for the design of sediment ponds and additional sediment and erosion control measures at the Vulcan property located in Winnsboro, Fairfield County, South Carolina. The described measures are necessary to control sediment and storm water runoff related to overburden and stockpile area construction.

The overburden areas will be located on the north end of the project site. The overburden areas are labeled as overburden areas 1 and 2, with Overburden Area 1 being the easternmost overburden area and Overburden Area 2 being the westernmost overburden area. Four sediment ponds, three for Overburden Area 1 and one for Overburden Area 2, will be needed due to the topography and size of the area. The four sediment ponds are labeled as Pond 1, Pond 2, Pond 3, and Pond 4. Pond 1 will be located on the east side of Overburden Area 1. Pond 2 will be located on the northwest side of Overburden Area 1. Pond 3 will be located on the southwest side of Overburden Area 1. Pond 4 will be located on the southwest side of Overburden Area 2. Storm water will be routed to the ponds via ditches, terraces, and down drains.

The sediment ponds will treat the storm water from the overburden area and the treated storm water will be discharged downstream. The locations of the overburden area and ponds can be found in the site construction plans.

SEDCAD hydrologic software was used to determine existing and future storm water runoff volumes and flow rates. The rainfall input data used to estimate storm flows in SEDCAD was provided by the SC DHEC Storm Water Management BMP Handbook. The ponds will meet the criteria of not overtopping during a 100-year storm event and will maintain a minimum of 6 vertical inches between the pond surface elevation and the emergency spillway during a 10-year storm event. The ponds have been designed to manage storm water flows from the overburden area designated on the grading plans. The ditch systems shown on the grading plans will allow for proper drainage to the ponds. The drainage areas for each pond are shown on a figure included as **Attachment 1**. The attachment titled Pond Parameters describes the

Mr. John Aultman, P.E.
March 10, 2020
Page 2

drainage areas, flow rates, and individual design guideline criteria for each of the ponds (**Attachment 2**). The design guideline criteria for the ponds are shown as a detail on the grading plans and in the attached chart titled Pond General Construction Guidelines (**Attachment 3**). Attachment 2 is intended for field use. The calculations for the sediment ponds are included as **Attachment 4**.

The predominant soil type in the area is Wilkes sandy loam. The Wilkes soil type carries a hydrologic soil group classification of C. Pre-construction ground cover is considered to be woods-grass combination (tree farm) in fair hydrologic condition. The curve number representing pre-construction conditions is 76. The future groundcover with the placement of overburden is considered to have approximately 50 percent grass cover with a relatively poor hydrologic soil condition. The curve number representing the future conditions is 86. There are areas that contribute runoff to the discharge points that will remain undisturbed and will bypass the four sediment ponds. Curve Numbers for these areas are identical to pre-construction conditions. A soil map is included as **Attachment 5**.

The sediment produced from the overburden area will be routed to the four ponds, which will maintain a sediment trapping efficiency of at least 80 percent during a 25-year, 24-hour storm event.

The following criteria will be identical for sediment ponds 1, 2, 3, and 4:

- Concrete riser structure
 - Minimum dimensions 3 feet x 3 feet
 - Trash rack
 - Floating Skimmers
- Rip-rap (SCDOT Class C) dike surrounding riser
 - #5 stone on face
 - Tie-in to earthen berm
 - Minimum 5 feet distance between rip-rap and riser
- Outlet pipe
 - Concrete or corrugated metal
 - Tie-in to riser
- Discharge location
 - Plunge pool-shaped rip-rap stone bed apron
 - Filter fabric underlain and tied in to adjacent grades
 - Apron length and width adequate for proper energy dissipation

Mr. John Aultman, P.E.
March 10, 2020
Page 3

- Berm designs
 - All Ponds
 - Minimum width of 25 feet
 - Tie-in to existing ground
 - 3:1 side slope design

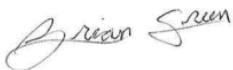

Check dams downstream of the pond discharge locations are recommended. The purposes of the check dams would be to reduce concentrated flows as an additional energy dissipation method and to provide additional settling.

In addition, best management practices — including, but not limited to, silt fence, check dams, storm water ditching, and grassing — shall be used throughout the site during and after construction of the overburden areas to control any and all erosion and/or offsite sedimentation.

Please review the package and respond with comments at your convenience.

Sincerely,

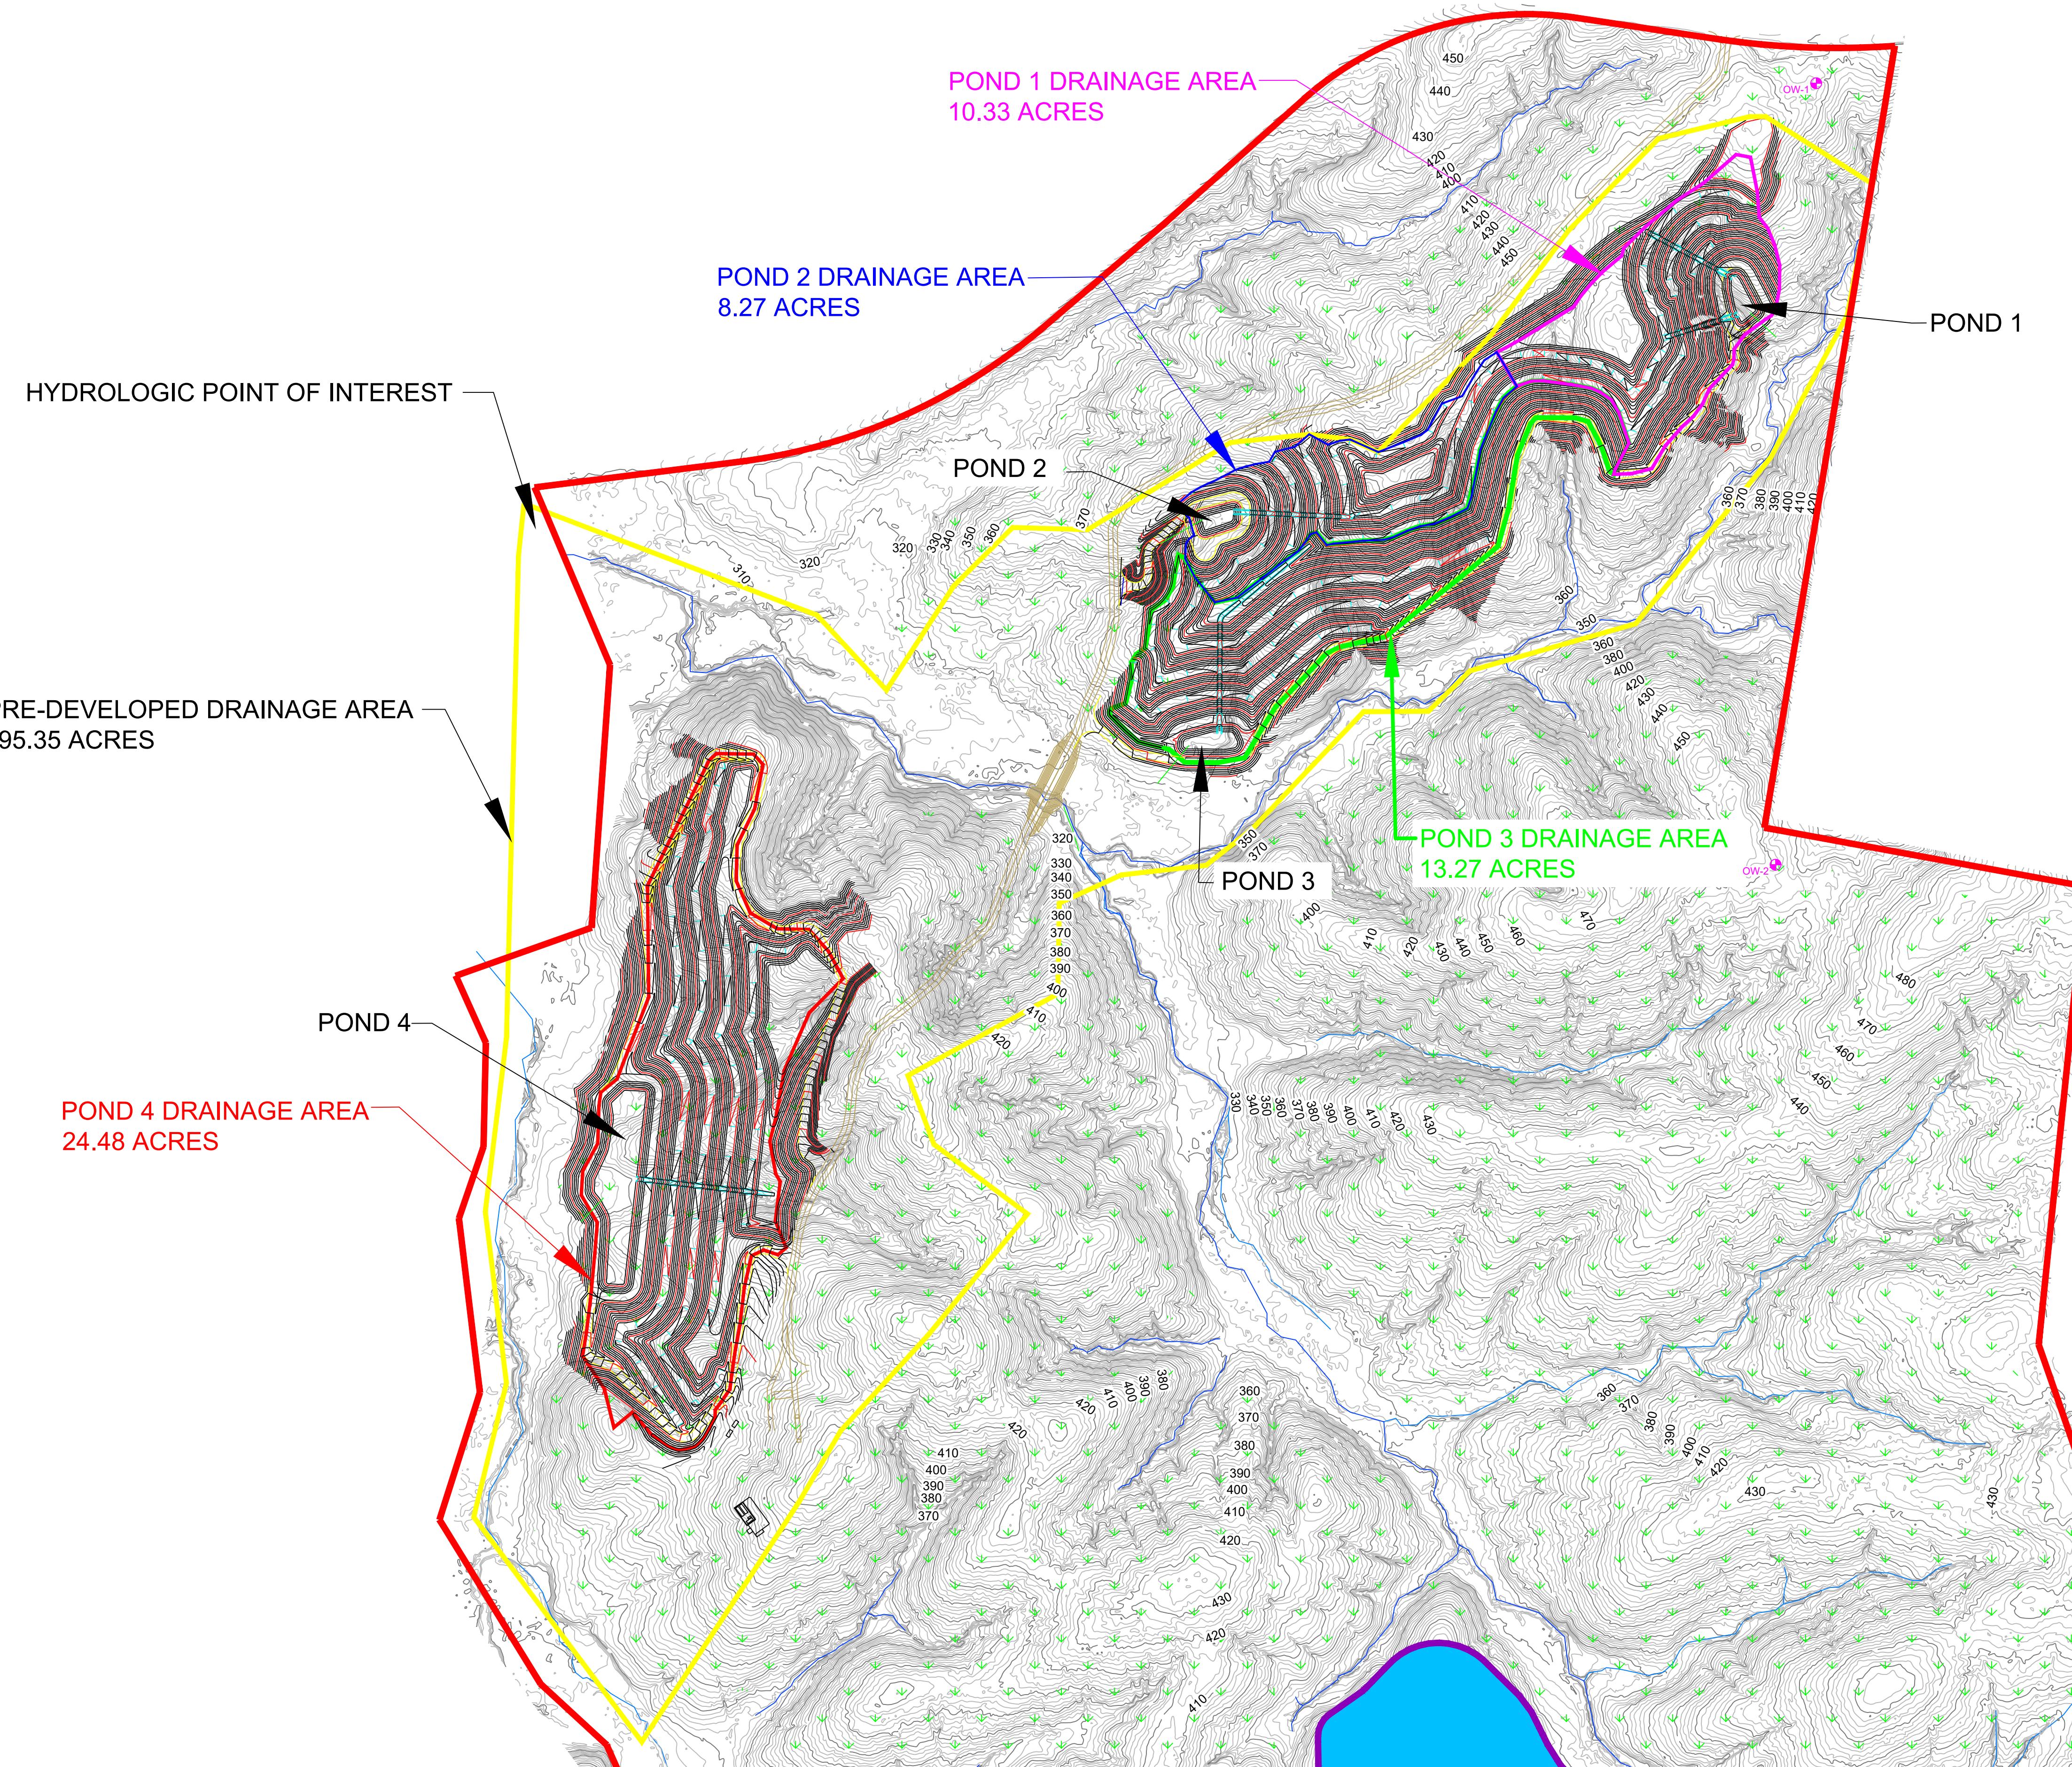

SynTerra Corp.

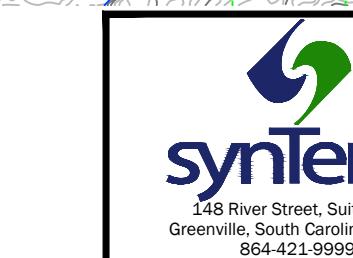

Brian Green, P.E.

Structure #3 (Pond)

Pond 3

Pond Inputs:

Initial Pool Elev:	333.50 ft
Initial Pool:	0.33 ac-ft
*Sediment Storage:	0.00 ac-ft
Dead Space:	20.00 %

**No sediment capacity defined*

Enhanced Perf. Riser

Riser Diameter (in)	Riser Height (ft)	Barrel Diameter (in)	Barrel Length (ft)	Barrel Slope (%)	Manning's n	Spillway Elev (ft)	Number of Holes per Elev
31.56	8.00	24.00	188.00	1.06	0.0160	340.00	4

Emergency Spillway

Spillway Elev	Crest Length (ft)	Left Sideslope	Right Sideslope	Bottom Width (ft)
341.00	31.00	6.66:1	6.66:1	20.00

Spillway Elev	Crest Length (ft)	Left Sideslope	Right Sideslope	Bottom Width (ft)
341.00	31.00	6.66:1	6.66:1	20.00

Pond Results:

Peak Elevation:	340.78 ft
H'graph Detention Time:	5.11 hrs
Pond Model:	CSTRS
Dewater Time:	5.08 days
Trap Efficiency:	84.88 %

Dewatering time is calculated from peak stage to lowest spillway

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Fairfield County, South Carolina

Survey Area Data: Version 14, Sep 16, 2019

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Apr 23, 2014—Oct 24, 2016

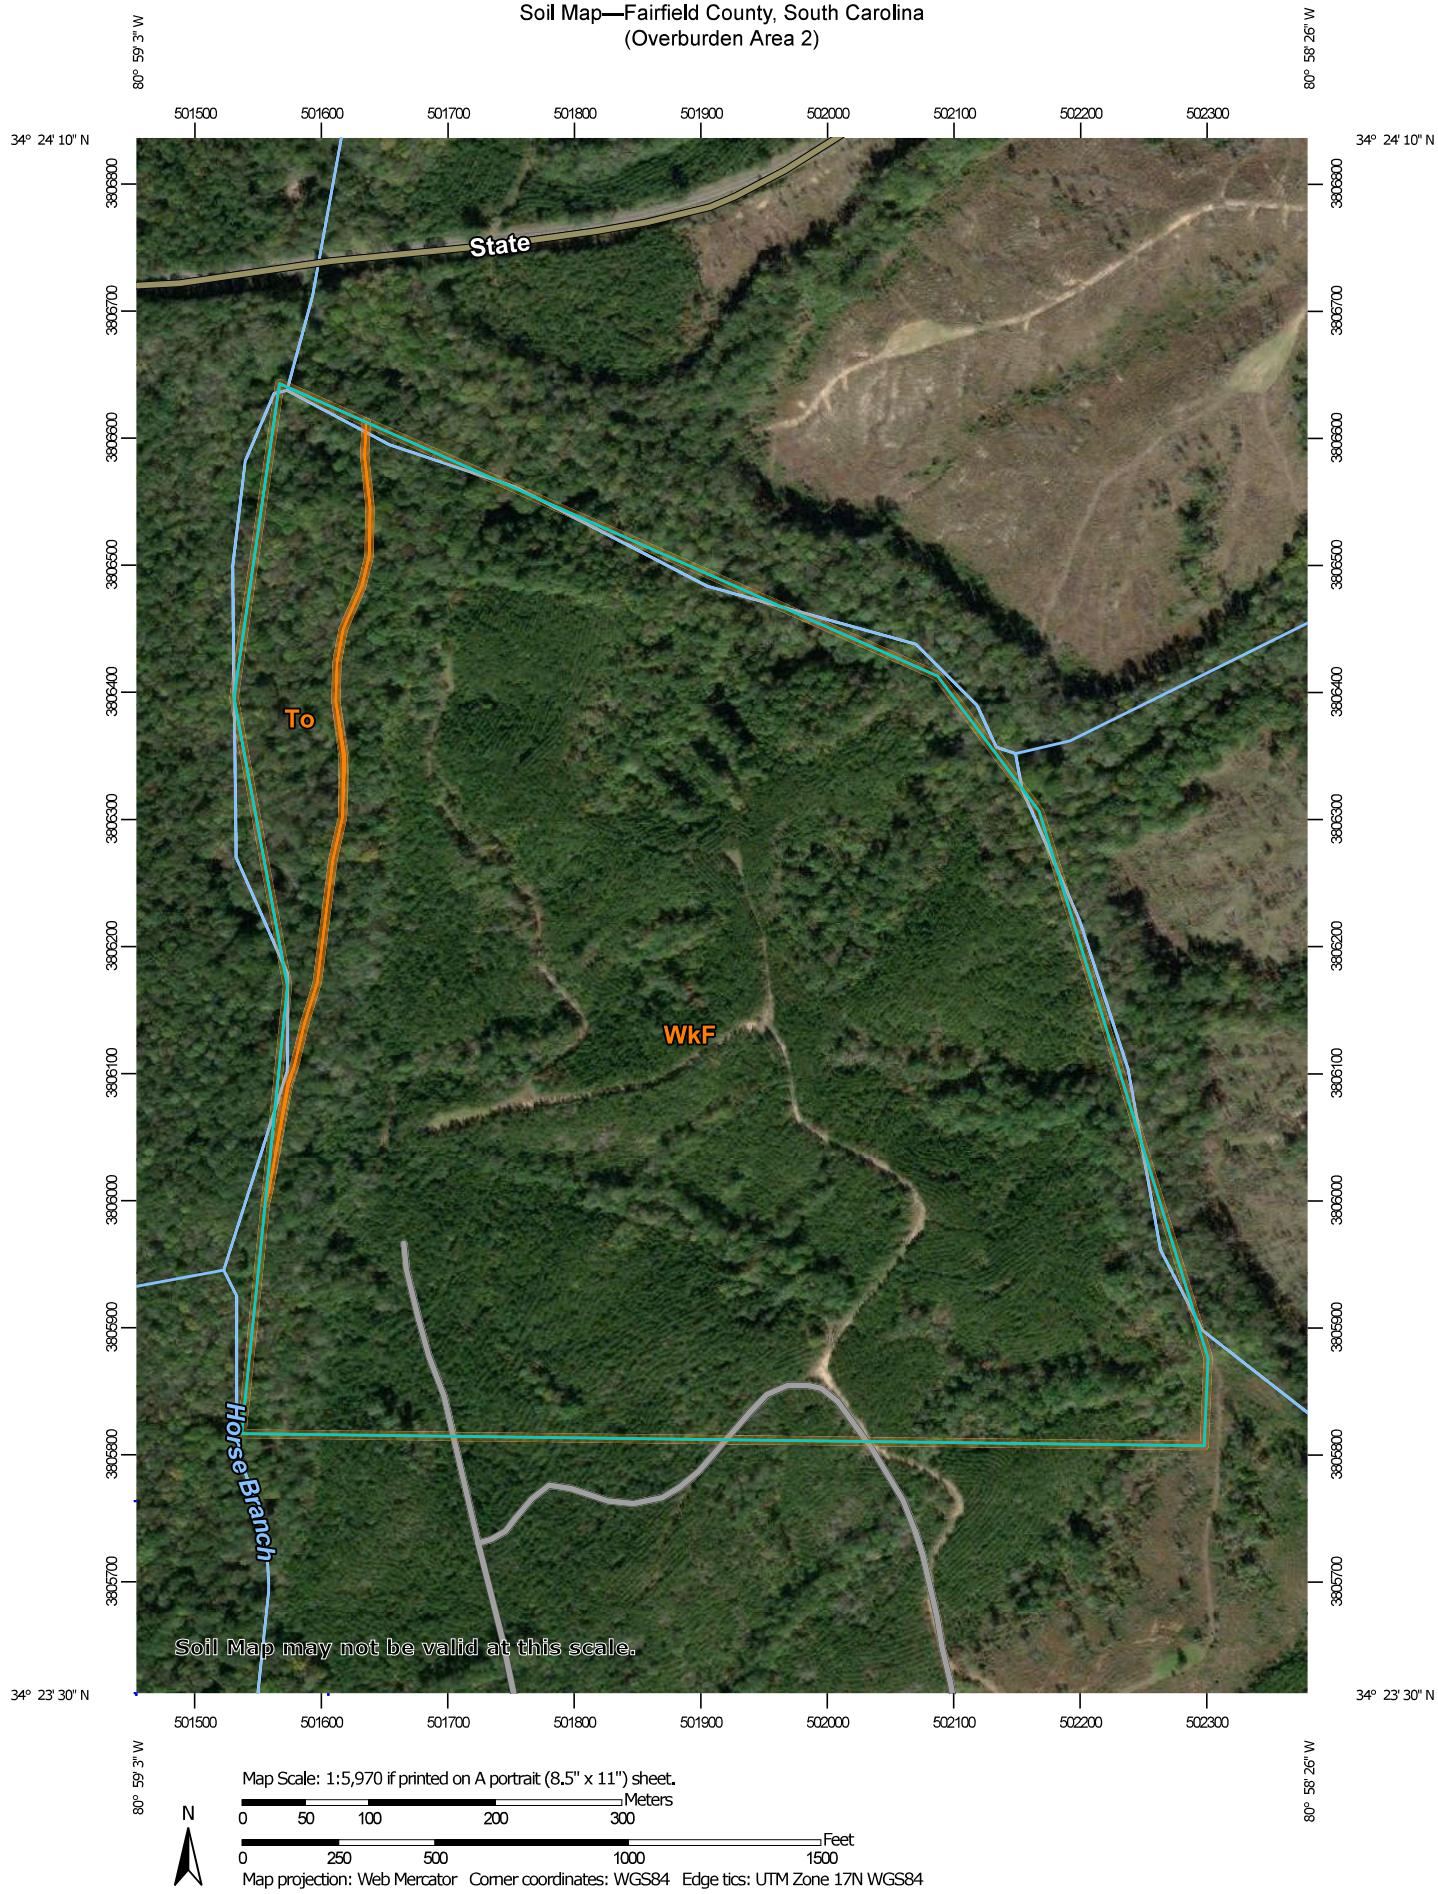

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
MdC2	Madison sandy clay loam, 6 to 10 percent slopes, eroded	1.1	1.8%
WkF	Wilkes sandy loam, 15 to 40 percent slopes	59.3	98.2%
Totals for Area of Interest		60.4	100.0%
